If more than one search is submitted, please prioritize searches in order of need.

 Please provide a detailed statement of the search topic, and describe as specifically as possible the subject matter to be searched. Include the elected species or structures, keywords, synonyms, acronyms, and registry numbers, and combine with the concept or utility of the invention. Define any terms that may have a special meaning. Give examples or relevant citations, authors, etc, if known. Please attach a copy of the cover sheet, pertinent claims, and abstract.

Title of Invention: Medical Instrument With a Non-Contact Readable Data Carrier
 Inventors (please provide full names): Hartmut Boche

Earliest Priority Filing Date: 7-26-99

For Sequence Searches Only Please include all pertinent information (parent, child, divisional, or issued patent numbers) along with the appropriate serial number.

A ^{medical} instrument used ~~as~~ with an endoscope. It includes a non-contact (wireless) carrier (transponder with an antenna) that reads environmental parameters, such as ^{- includes circuit & data memory unit} temperature, pressure, humidity, radiation, & shock or impact loads. This information is carried to a remote location & gather data from the carrier.

The carrier is embedded into the instrument and encased in a medium. The medium could be silicone, epoxy resin, theroplastic material, cement, or ceramic. This medium floats the carrier to prevent against physical & mechanical shock or loads.

The material of the medium and the instrument itself differ in elasticity modulus and heat conductivity in order to guard against shock and loads. ~~Amended the claim~~

Abstract: **Embedding** sensors in structural composites has been a topic of research in recent years. **Embedded** sensors can be used to monitor and optimize the manufacturing process, to monitor performance during use, and for structural health monitoring in high-performance applications. The US Naval Research Laboratory is funding a multi-disciplinary team to develop micro-machined sensors and an associated remote-querying capability to allow self-contained microsensors to be **embedded** in a composite structure and queried using methods that do not require physical connections. The sensors are to be left in place for the lifetime of the structure, are powered by the querying apparatus, and require no penetrations through the surface of the structure. Part of this work included studying electromagnetic propagation into graphite-epoxy (conductive) composites. A key part of this research has been the development of **embeddable** antennae that can operate within a conductive composite matrix with the efficiency required to both absorb power for the circuitry and to transmit and receive data. This paper describes the integrated approach taken to realize the goal of an interrogatable strain rosette that is **embedded** 0.25" into a graphite composite plate. Aspects of the sensors, the **transponder**, and the antenna are also covered. (5 Refs)

Abstract: **Embedding** sensors in structural composites has been a topic

of research in recent years. **Embedded** sensors can be used to monitor and optimize the manufacturing process, and for structural health monitoring in high-performance applications. To date, optical fiber sensors have been the principal sensing technique for these applications. There are well-known problems with optical fiber sensors, including manufacturing costs and fragility in ingress and egress from the structure, and the interdependence of strain and temperature measurements. The USA Naval Research Laboratory is funding a multi-disciplinary team to develop micro-machined sensors and an associated remote-querying capability to allow self-contained microsensors to be **embedded** in a composite structure and queried using methods that do not require physical connections. The sensors are to be left in place for the lifetime of the structure, are powered by the querying apparatus, and require no penetrations through the surface of the structure. Part of this work includes studying electromagnetic propagation into graphite-**epoxy** (conductive) composites. A key part of this research has been the development of **embeddable** antennas that can operate within a conductive composite matrix with the efficiency required to both absorb power for the circuitry and to transmit and receive data. This paper describes the integrated approach taken to realize the goal of an interrogatable strain rosette that is **embedded** 0.25 inch into a graphite composite plate. Aspects of the sensors, the **transponder**, and the antenna are also covered. (0 Refs)

Journal: AUSTRALIAN JOURNAL OF EXPERIMENTAL AGRICULTURE, 1996, V36, N1, P 19-22

ISSN: 0816-1089

Language: ENGLISH Document Type: ARTICLE

Abstract: The performance of electronic identification transponders **encased** in **ceramic** capsules inserted into the reticulo-rumen was assessed in 3 groups of cattle: 1059 two-year-old feedlot steers, 11 penned calves and 46 grazing calves. Insertion of capsules presented little difficulty and at slaughter, examination of the reticulorumen showed no visible signs of damage to the reticulo-endothelium due to the capsules. The retention rate of the capsules was 100% in adults when slaughtered 55-107 days after capsules were inserted. All Losses of capsules from calves occurred before calves were 21 weeks of age. Transponders were successfully read both in the live animal and in the body on the slaughter chain. All transponders in the reticulorumen of grazing calves were functioning normally up to 46 weeks after being implanted. At slaughter, capsules were recovered easily with no risk of contaminating meat or by-products. Small steel metallic objects near the capsule appeared not to affect the reading distance of the **transponder**.

JOURNAL ANNOUNCEMENT: IAA9811

We present the design and the results of tests performed on a CMOS IC which interfaces with MEMS capacitive sensors and with an antenna coil for **embedding** inside physical structures to monitor local stress and strains.

Using inductive coupling, the IC powers itself from a pilot signal at 130 kHz, which it receives from an interrogating device called the Reader. The IC then makes measurements of the sensor's output and converts the measurement to a binary code, which is then transmitted to the Reader by differential phase-shift-key (DPSK) modulation of a 65-kHz signal across the antenna coil. The IC has roughly 3000 transistors and was fabricated using 2-micron double-poly- **silicon**, double-metal technology at a commercial foundry. The IC uses a Delta-Sigma A/D converter for the measurement of the capacitance of a sensing capacitor as compared with that of a reference capacitor (Author)

Abstract: Three new products have been developed by Allibert Handling, part of the Sommer Allibert Group, based in Gloucester and these are reviewed. The first is a reusable delivery pallet for holding dynamic loads up to 500kg as well as 1 tonne static loads. The Packpal is available in eight variations based on 80 x 1200 and 1000 x 1200mm, in ventilated or solid deck versions. They are stable to minus 40 deg C. With a capacity of 78 litres, the Allibert Distribution Box has an integral hinged lid and an innovative water channel and perimeter seal to restrict water ingress up to 80-90%. It may be stacked up to six high. A compact trolley, the Multimover, which may be transported in a car boot, accepts loads up to 300kg and has a tough **epoxy** coated handle. This is available in fold and lock format or detachable. Planned developments include a new wheelie bin. Also, to allow tracking within the manufacturing and storage process, the possibility of **embedding** low cost Texas Instruments' transponders within pallets is being explored. Illustrations are included.

Analytical Instruments

Monolithic Column Material Aids HPLC

Chromolith materials by Merck KGaA, Darmstadt, Germany, are the first **silicon** -based monolithic separation materials for high performance liquid chromatography. Products such as Chromolith Speed ROD RP-18e (50-4.6 mm) and Chromolith Performance RP...mm, and relies on volume production and high reliability. The volume production is automatic hybrid integration for the laser diode coupled by fiber' onto a **silicon** chip-on-carrier with micron accuracy with plastic dual-in-line flat package. The high reliability is based on a **silicone** transparent gel encapsulation technique that maintains high reliability under high temperature and humidity.

The HL1328DJS from Hitachi Ltd., Tokyo, and Nortel Networks, Paignton, UK, is...

...attached directly to a ship. The transponders acoustically talk to each other setting up a calibrated 3-D underwater grid. The diver dons a tracking **transponder** and head-mounted display. Not only can a diver's position be accurately determined and mapped with SeaViz, the system can be used to guide...temperature capabilities of the metallic structural components in the engine hot section. It is generally agreed that upper temperature limits of metals have been reached. **Ceramics** exhibit superior high-temperature strength and durability, but **silicon** -based **ceramics** suffer from rapid surface recession in combustion environments due to reaction with corrosive species.

Two new coatings-- **Silicon** /Mullite/BSAS and **Silicon** /Mullite+BSAS/BSAS EBCs (Environmental Barrier Coatings)--protect **silicon** -based **ceramics** from harsh environmental attacks, most notably water vapor and molten salts. In combustion environments, the new coatings dramatically improve the performance of **silicon** -based **ceramics** and have accumulated 14,000 hrs of operation at ~1250 (degrees) C.

The coatings were developed by a team of researchers from NASA Glenn Research...Martin Aeronautics Company, Fort Worth, Texas; and NASA Langley Research Center, Hampton, Va.

New Process Creates ECOCERAMICS

Environment Conscious **Ceramics** (ECOCERAMICS) are a new class of materials fabricated by pyrolysis of natural wood or wood sawdust or their combinations. The manufacturing process is suitable for producing dense or

porous **ceramics** of non-oxide and oxide systems.

The microstructure, composition, and thermomechanical properties of ECOCERAMICS can be tailored according to component design and application requirements. A number of key material properties such as strength, toughness, and **environmental** and **thermal shock** resistance can be achieved by utilizing variations in microstructural design and composition. ECOCERAMICS maintain their reliability at high temperatures and exhibit mechanical properties and environmental resistance comparable to traditional **ceramics**.

This manufacturing process was developed by researchers at NASA John H. Glenn Research Center at Lewis Field, Cleveland, and M. Singh from Dynacs Engineering Co. Inc., Cleveland.

ABSTRACT: An implantable and extractable **sensor** is used for monitoring blood flow and vessel characteristics within a patient. The **sensor** includes a structurally supportive shuttle that has an angularly offset shelf. A transducer is mounted to this shelf and offset at the same angle so as to utilize the Doppler effect. **Silicone** is injection molded around the assembly to provide a housing having a plurality of cutouts that expose portions of release wires running through the housing. The **sensor** is attached to the vessel by suturing around the exposed portions of the release wires. When the wires are retracted, the **sensor** can be extracted from the patient without having to reopen the **surgical** wound. The shuttle provides a consistent location to mount a transducer and also provides the structural support for the **silicone** housing.

Journal Announcement: 0006W2

Abstract: A single module, TETS and telemetry operated, hermetically sealed controller compatible with the dual coil Jarvik 2000 intraventricular axial flow rotary blood pump has been designed, fabricated, tested in vitro, and implanted in a 74-kg calf at the Texas Heart Institute (ongoing at 65 days). The purpose of this paper is to describe the design philosophy, fabrication techniques relevant to the pacemaker-style packaging concepts and bench testing results leading up to this first in vivo implant. Included within the single module are microprocessor based electronics (with manual and automatic modes) and internal batteries (3 X prismatic C cells, 1.4 AH) provided by Wilson Greatbatch (WG) LTD. The electronics includes main (M) and backup (BU) motor controllers, M and BU TETS power conditioners, an RF telemetry link, battery charging circuitry, and appropriate **sensors**. These are packaged within a hermetically sealed titanium can using WG - Hittman feedthroughs **embedded** in an **epoxy**, pacemaker-style header (MedSource) designed to accept a unipolar ECG lead, two triaxial connectors (M and BU stators), and two biaxial connectors (M and BU TETS). External to the body are a TETS oscillator, primary coil, 4 X D li-ion battery pack and power supply. Pre-operative submerged saline testing demonstrated system efficiencies of 6-8% depending on load and internal temperatures of 47-50 degree C. (Author abstract)

Journal Announcement: 9603W5

Abstract: Micromechatronic systems integrate miniature precision mechanisms, actuators, **sensors** and **embedded** control. Their intrinsic features are electively suitable for application in the medical field, in particular when miniaturization, reliability and intimate interaction with the human body are required. Microsystems can be exploited for acute intervention or for permanent (short and long term) implant in the human body. This paper focuses on microsystems for permanent implant, and discusses their problems and perspectives with reference to some representative fields of application. Such fields include **sensory** substitution (such as microsystems for hearing aids, artificial eyes and artificial touch); internal organs substitution (in particular microsystems for drug delivery and micro bio-artificial organs); and neural prostheses (an example of regeneration-type neural interface is presented where axons regenerate through metalized holes microfabricated in a **silicon** dice). We

conclude that medical applications of microsystems and micromachines may have a tremendous impact on the quality of medical care and become a very attractive industrial market, provided that some key technical problems are addressed and solved. (Author abstract) 36 Refs.

Journal Announcement: 8604

Abstract: Batch-fabricated thermometer arrays have been developed for temperature profile measurement during hyperthermia treatment of cancer. An array consists of 20 **silicon** islands interconnected by flexible gold leads, both **embedded** in a flexible polyimide layer. Each island contains one p-n diode, which is used as a thermometer. The linear arrays are 1 mm wide by 0.4 mm thick; array lengths of 20 cm, 10 cm, and 3.5 cm have been designed, and fabrication of the 3.5-cm arrays is complete. Two arrays can be simultaneously connected to a portable microcomputer-based system for calibration, data acquisition, temperature profile display, and data logging onto floppy diskettes. The flexible array fabrication technology also lends itself to two-dimensional arrays of **sensors** for robotic and biomedical uses. 3 refs.

Basic investigations on an intraocular implant system for continuous
measurements of the intraocular pressure (IOP) are introduced. The system
consists of a pressure sensor connected to transponder components
integrated in the haptic of an artificial soft intraocular lens. External
transponder components will be integrated in a spectacle and a hand-held
unit. The influence of the lens material on the pressure sensor performance
will be discussed in detail. Two pre-version of the concept mentioned will
be introduced. In the first version, a pressure sensor was connected to a
microwire. In a second version, the sensor was connected to transponder
components for wireless data and energy transmission. Both versions were
encapsulated in standard soft intraocular lens material. Pressure
measurements show the same sensitivity before and after encapsulation. In
addition, a small offset was observed due to the influence of the silicone
coating. The performances of the sensors have the same precision as widely
accepted gold standard for the determination of the IOP.

ABSTRACT: The "float chuck FU type" device which can meet the LCD
manufacturing process and carries a large and thin type glass substrate
which is contactless and non-dust is introduced. On this device, the
following are described : background of development, operation
principle, features, structure, examples of use, etc. This paper
describes the features of this equipment and the explanation of the
mechanism such as the airflow does not hit the glass substrate directly
when high speed airstream is spouted out the substrate.

ABSTRACT: We have developped a small one, sized .PHI.8*5(mm), as the data
carrier of non - contact ID system. This data carrier is made of COB
assembly of bare chip IC in form of small one. In this company, COB
assembly (wire bonding assembly) on the glass-epoxy, print circuit
board is increasing and it is necessary for us to establish this
technology as soon as possible. C-MOS IC is different from Bi-Polor IC
and the silicone ingredient included in its pattern exerts a serious
influence on assembly stress. As a results, harder we set the wire
bonding force, bigger the damage to IC becomes. This time we have in
experiment and investigation or the COB assembly technoloyg included ID
system's data carrier using Taguchi-Method from the following points of

views. (1) The influence of assembly stress by difference of the constitution between C-MOS IC and Bi-Polor IC. (2) How to set the most suitable wire bonding condition. (3) How to investigate the reliability. The result is that we have selectd control factors as the main factor in the assembly stress and have established how to set the most suitable condition and have developped applications to products. (author abst.)

Priority Applications (No Type Date): JP 98279137 A 19980930

Patent Details:

Patent No	Kind	Lan Pg	Main IPC	Filing Notes
JP 2000113154	A	5	G06K-019/077	

Abstract (Basic): JP 2000113154 A

NOVELTY - A copper antenna coil (4) is arranged surrounding the

circuit board (3) in which IC chips are mounted. ABS resin (5) is provided to the seal. The antenna coil and silicone resin (6) which is softer than ABS resin seals the circuit board. The ABS resin seal surrounds the silicone resin seal.

DETAILED DESCRIPTION - An INDEPENDENT CLAIM is also included for manufacturing method of data carrier.

USE - For e.g. non-contact tag affixed to goods for communicating information of external device.

ADVANTAGE - Destruction of internal components like IC chip is reduced as attenuation of oscillation is carried out by silicone resin before the impact travels to IC chip.

DESCRIPTION OF DRAWING(S) - The figure shows sectional side view of data carrier.

Patent Details:

Patent No	Kind	Lan	Pg	Main IPC	Filing Notes
JP 11102424	A		6	G06K-019/07	

Abstract (Basic): JP 11102424 A

NOVELTY - The area including circuit board (2) its junction and an antenna coil (1) is covered by a buffer layer (3') comprising gel-like resin (3b) made from a silicone resin film (3a). An outer cladding surrounds the circuit board, the buffer layer and the antenna coil.

USE - For loading various rubber goods.

ADVANTAGE - Prevents destruction of internal component caused due to stress generated by external mechanical shock. Since a buffer layer comprising gel-like resin is used, handling is simplified and workability is improved.

DESCRIPTION OF DRAWING(S) - The figure shows the sectional view of non contact data carrier package. (1) Antenna coil; (2) Circuit board(3') Buffer layer; (3a) Silicone resin film; (3b) Gel-like resin.

Patent Details:

Patent No	Kind	Lan	Pg	Main IPC	Filing Notes
JP 9160306	A		7		

Abstract (Basic): JP 9160306 A

The image formation method forms a superimposed colour image by repeating a series of the processes, reversal-developing the latent image on the photosensitive material, formed by the charging and image-exposing. The reversal development uses two components (the carrier and the toner) type non - contact type development. The carrier is silicone resin-coated magnetic carrier.

The surface magnetic field on the development sleeve in the development region of the developing apparatus is 1000 G - 2500 G. The volume-average particle diameter, the saturated magnetisation, and the specific electrical resistance of the silicone resin-coated magnetic carrier are 10 - 50 microns, 10 - 50 e mu /g, and 100000 Omega cm. - 1 x 10¹² Omega cm. respectively

ADVANTAGE - The colour image formation method gives image with excellent high image quality. The apparatus has excellent high durability.

Abstract (Basic): JP 5045936 A

Developer includes carrier and toner. The developer is supplied to a developing area in an AC electric field while controlling the developer amt. by pressing a developer amt. controlling member onto the developer layer of a developer transporting member, for developing a latent image on an image holding member by non - contact development. The carrier is obtd. by coating particles with a resin coating layer including silicone resin by mechanical impact force, and the carrier has less than 60 microns of wt. average particle size.

The coating resin of the carrier pref. comprises silicone resin fine particles and styrene and/or acryl resin fine particles, or copolymer resin fine particles of them.

USE/ADVANTAGE - Toner spent to the carrier may be prevented, and scattering of the toner is prevented. An image of high density and high quality may be obtd..

DATA CARRIER MODULE, DATA CARRIER, AND METHOD FOR MANUFACTURING DATA CARRIER

PUB. NO.: 2001-243437 [JP 2001243437 A]

PUBLISHED: September 07, 2001 (20010907)

INVENTOR(s): KOBAYASHI MIDORI

APPLICANT(s): TOSHIBA CHEM CORP

APPL. NO.: 2000-054504 [JP 200054504]

FILED: February 29, 2000 (20000229)

ABSTRACT

PROBLEM TO BE SOLVED: To provide a non - contact data carrier which can be made improved in mechanical strength, small in size and light in weight, and manufactured by simple technology.

SOLUTION: An IC chip 62, a capacitor 64, and a resistance 65 are mounted on a lead frame 61 and an area except a sensor mount part 65a is molded by transfer by using epoxy resin 66. The IC chip 62, capacitor 64, and resistance 65 are sealed and a recessed cavity part 65b as the mount space for a pressure sensor element 7 is formed. Then the pressure sensor element 7 is mounted on the sensor mount part 65a and the gap between the pressure sensor element 7 and recessed cavity 65b is filled with silicone resin

70, which is set. Then an antenna coil is connected to the data carrier module 6 obtained by cutting tie bars of the data carrier module 6 to manufacture the contactless data carrier 3.

ABSTRACT

PROBLEM TO BE SOLVED: To provide a manufacturing method for a noncontact data carrier , whose precise pressure responsiveness can be displayed and whose mechanical strength can be increased.

SOLUTION: A printed circuit board 22, on which an IC chip 21 and a pressure sensor element 18 are mounted, is mounted inside an armor container 24. Internal calibration terminals 23 and antenna internal connecting terminals 151, which are installed on the printed-circuit board 22 and external calibration terminals 25 and antenna connecting terminals 152 which are installed, so as to be passed through to the outside from the inside of the armor container 24 are subjected to wire-bonding respectively. A lid 29, which has an opening part 28 is put on the armor container 24, a silicone resin 27 is filled into the armor container 24, and the component 30 for the data carrier is manufactured. After the component 30 for the data carrier is calibrated, antennas 15 are connected to the antenna connecting terminals 152 at the outside of the armor container 24, to manufacture noncontact data carrier 3.

ABSTRACT

PROBLEM TO BE SOLVED: To obtain a compact pressure sensor module that can be manufactured easily and inexpensively and has large bending strength.

SOLUTION: A lead frame 4 where a circuit part for composing a pressure sensor and an IC chip 3 (chip parts 8) for composing the circuit part of a non - contact data carrier are mounted is subjected to transfer forming by an epoxy resin or the like, thus manufacturing a resin forming body. At this time, a cavity 6 where a lead frame surface for mounting a pressure sensor chip 2 is exposed to a bottom surface is formed at a resin forming body 5. The pressure sensor chip 2 is mounted into the cavity 6, a pressure transferring resin 7 such as a silicone resin is filled into the cavity 6, and the pressure sensor chip 2 is sealed by the resin. Then, an unneeded lead frame part is cut for calibrating the pressure sensor, thus obtaining a pressure sensor module 1.

ABSTRACT

PROBLEM TO BE SOLVED: To provide a noncontact data carrier of high sensitivity by reducing the force that is applied to the magnetic core of an antenna due to the stress caused by the heat contraction or the hardening contraction of resin when an internal parts is sealed by the resin.

SOLUTION: An almost cylindrical antenna magnetic core is obtained by winding an amorphous magnetic alloy thin belt of an Fe group, a Co group or an Ni group, etc., in one or more layers according to the shape of a sheath case 30 of a noncontact data carrier 1. Then the antenna magnetic core is put into a cylindrical bobbin 22 which is made of the polyamide resin, etc., and contains a coil 23 where a copper wire is wound round. Thus, a transmitting and receiving antenna 20 is obtained. Then the antenna 20 and a circuit parts 10 are put into the case 30 and the elastic and fluid hardening resin such as the urethane resin, silicone resin and epoxy resin is injected into the case 30 and solidified. Then the parts 10 is sealed up by the sealing resin 40 serving as an elastic body. Thus, the carrier 1 is obtained.

ABSTRACT

PROBLEM TO BE SOLVED: To protect and strengthen the rear surface of an IC chip at a low cost and to reduce a fault occurrences in the IC chip in a non - contact data carrier on which the thin IC chip is mounted by a flip chip method.

SOLUTION: A sealing resin film (21) is formed on the rear surface and side faces of a silicone wafer (20) on which a circuit pattern is formed with thermosetting resin such as epoxy resin , or a resin sheet such as polyethersulfane and a metal sheet (23) such as aluminum are adhered with an adhesive 24 such as the epoxy resin . Next, an IC chip 10 where a rear surface protective layer 12 is formed on the rear surface is obtained by dicing the wafer (20). Subsequently, the chip 10 is mounted on a thin film-shaped antenna coil 1 formed on a resin sheet 2 by a flip chip method. A non - contact data carrier is obtained by adhering another resin sheet 2 on the sheet 2 and sealing with the sheets 2 and an adhesive layer 4.

ABSTRACT

PROBLEM TO BE SOLVED: To improve a manufacturing yield by facilitating a thickness reduction of resin-sealed non - contact data carrier and the manufacture.

SOLUTION: This manufacturing method comprises the steps of hot press molding to obtain sheathing resin 7 of non - contact data carrier in a reduced pressure atmosphere, and introducing fluid 10 such as gas or liquid into a sealed space 11 of the press as pressurizing means to raise pressure in the space 11. In this case, as the pressure, a structure for applying to a material to be molded via a pressurizing plate 12 made of an elastic material such as silicone rubber is used. Such pressurizing means is used to avoid concentration of excess pressure to an internal component 4 at the time of molding by a hot pressing method, the possibility of damaging the component 4 can be remarkably reduced, thereby improving its manufacturing yield.

ABSTRACT EP 260238 A2

A device for transmitting electric energy to electric equipment,
primarily computers and data nets, which device is intended to be
connected between a voltage source and the electric equipment. The
invention is characterized in that it is provided with a generator
(30,31) comprising a piezo-electric element, which generator is intended
to be connected to said voltage source and to generate a high-frequency
mechanical wave motion, that a bar-shaped transmission member (32) is
provided to transmit said motion to a receiver (33-35), which
transmission member comprises a non-magnetic and electrically insulating
material, in which the mechanical wave motion can be conducted, that said
receiver, which is intended to be connected to the electric equipment, is
capable to convert said mechanical wave motion into an electrically
varying voltage by means of a piezo-electric element (33), which is in a
mechanical connection with said transmission member.
